Impact of post-endodontic prostheses in bovine mandibular premolars. The aim of this study was to evaluate the treatment of bovine mandibular premolars with post endodontic prostheses in order to evaluate different systems. Roots that were maintained for more than 10 years after resective endodontic treatment have been found to be inclined to re-erupt, especially in apical third. Today, the hypothesis that maintaining intact teeth for 10 years or more after endodontic treatment is an important factor in predisposing root resorption is not accepted. The treatment of a canal-treated tooth in the same patient as a second molar, inserted 8 to 20 years later, has been shown to be contraindicated because of the possibility of root resorption in the first tooth. This study evaluated the treatment of mandibular premolars in bovine teeth maintained for 10 years and 8 years, respectively. Twenty specimens with two single-rooted canals in the mesial and distal thirds were selected for the experiment. Each tooth was divided into four experimental groups: C (Resorb 2, Fuji), R-P (Resorb 2, RBM), C-P (Resorb 2, Hybrid), and R (Resorb 2, Guttapercha). A total of 8 mm in length of root filling was performed with Gutapercha as the control and Resorb 2 with hybrid and resin as the experimental groups. After 2 weeks, the specimens were restored and subjected to compressive force in the palatal direction using a KFM. The average failure load was of 354.7 N, 443.1 N, 615 N, and 583.4 N for groups C, R-P, C-P, and R, respectively. In the present study, it was found that hybrid and resin posts were more successful than the control in resisting compressive loads.Android's Matias Duarte: "I was an iOS developer before I was an Android developer." Smartphones might no longer be the newest computing device, but Matias Duarte made a point to talk about the work he's done on iOS and Chrome OS before moving to Android. As he told a crowd at Google I/O in June, he got into mobile during the iPhone's initial launch back in 2007, and he was an iOS developer "before I was an Android developer."

Q: Getting the lat and long from an email address What is the most efficient way to obtain lat and long from an email address? I have created the following code, which I am hoping will be the easiest one to understand, but even then, I don't know what code to use to convert the lat and long to an integer. What I have is a class called UserDetails, which has a getLocation() function and a getEmail() function. private String location; private String email; public String getLocation() { // code to find the long and lat } public String getEmail() { // code to find the email address } public class Reader { public static void main(String[] args) { UserDetails userDetails = new UserDetails(); userDetails.getLocation(); userDetails.getEmail(); } } A: The constructor for a UserDetails object is a bit tricky as there are a number of different, but similar, approaches you could take. One thing to be aware of is that the getLocation() method must return something meaningful. For example, if you were to use latitude/longitude to find an address, then you'd need to know the exact location that the address was within. The reason I say this is that, as the latitude/longitude values that are returned are usually in meters, with metres being about 3.9 miles long, it may be the case that if the system is really close to a city centre, and therefore an address that you're interested in is relatively near to the city centre. However, as you get further away from a city centre, it's quite possible that it will be given an arbitrary 'longitude' value that could mean it's a completely different location, to the point where you might as well be looking for the nearest Starbucks in Australia. (If you're interested in finding Starbucks near London, you might use a radius of ~750 miles around London to start with, and then return the nearest location for this radius, and so on.) In other words, if you're going to return an address using lat/long values, then you'll probably have to have an API to take the latitude and longitude values and actually
